Dear Mr. Maunder

Thanks for your
suggestion
in this recommendation
for a Shortened form
of
Words. I don't
think I shall
adopt it as
I prefer the
full form
of
words
as
they
are
in
the
Prayer
Book
but
I
will
kindly
remember
your
suggestion
should
I
ever
have
occasion
to
use
it.

Yours truly
Oliver Lodge

13 May 1959.

Dear Silvanus,

I have just seen that you are going to give the Students a Lecture on Monday.

Unfortunately I have arranged to go to London from Monday to Wednesday, so that I am afraid I shall miss your visit, and not be able to put you up.

I expect however that you are staying with one of the Engineers — probably Kapp.

You will, I am sure, understand that the my arrangement was made some time ago, before I knew anything of your possible visit.

I wish I could have been up this week instead, but I have been full of business here. I should have liked to have gone to the

DSI

Royal Society Soiree,
likewise to the Royal Society
Meeting this afternoon,
and also to have heard Hale
at the R.I. on Friday.
But it has all been
impossible.

I feel sure they will
give you a good reception,
though this Term is not the
best by any means for
lectures. Yours ever truly,

Oliver Lodge

Dear Sir

I cannot undertake to be in London in april. I recommend Sir William Barrett as the oldest living pioneer in psychic research & a well-known & distinguished worker, as one of the chairmen; & either Dr. Abraham Wallace of Harrow, or Sir Lawrence Jones Bart. of 39, Harrington Gardens, S.W.7 for the other.

Yours faithfully

Oliver Lodge

30 Oct. 1912.

My dear Principal,

So many Colleagues are ill just now that a great deal of extra work falls upon me, and I am unable to undertake any outside duties except the very necessary ones.

I had promised to go to Bristol to speak for the W.E.A. there, but at the last moment was prevented from going. And I am afraid that if I tried to fix to go to Newcastle I should be in the same predicament. Hence, although I think the matter somewhat important, I do not think I could promise to come, and I think the best way is to say so from the first.

If you get Temple and Mansbridge (as no doubt you will)

Lodge 7/6

20 Nov. 1911.

Dear Mr. Allen,

I have no doubt myself that Mass ought to be defined as ratio of Force to Acceleration, and that Force ought to be defined in some primary statical manner without reference to either Mass or Acceleration. (The difficulty is to give a purely metrical to statical definition.)

I have said this from time to time, but to say it again in "Nature" with any satisfaction would take a little time, which at present I can ill spare.

Accordingly I do not know that I shall join in the controversy, but we shall see.

Yours faithfully,

Oliver Lodge

DSI

experiments to a number of masses taken in pairs, and finding that the results are consistent." But unfortunately the results are not consistent if we extend our experiments beyond the range realised in Hicks's balance to cases where the relative velocity is comparable with that of light.

The reviewer speaks of the desirability of finding an absolute measurement for force, by which I understand him to mean a scale which shall be independent of the behaviour of any particular body. This is it may be desirable but so far possible as I can see it is not possible if we take into account the change in mass with velocity? The tendency of modern scientific discussion is to emphasise the relativity of our knowledge and it would appear that force & mass are no exception to the general principle

As the reviewer has penetrated the modest cloak of my initials, I subscribe myself H. S. Allen

1911

KING'S COLLEGE SENIOR COMMON ROOM LONDON.

I am greatly indebted to your reviewer for his courteous reply to my request for a definition of mass apart from force. in Nature for Nov 16

I am glad to find that as regards the qualitative definition we are in substantial agreement. As regards a quantitative definition it is, as he points out, obvious that it is meaningless to define unit force as that which produces unit acceleration in unit mass, and then to define unit mass as that which acquires unit acceleration under the action of unit force.

of our time, present in my thoughts in asking for a defn of mass and the cause of my interpellation,

We must select one or other of these alternatives definitions, and a system of measurement sufficiently consistent for ordinary practical use can be based upon either alternative. It is not my intention to reopen the old controversy as regards ~~the~~ the so-called engineering and scientific units. That is a question that can be settled mainly from considerations of practical convenience.

But from the theoretical point of view it is important to consider whether we are to define mass in terms of force or force in terms of mass. Though Thereal difficulty is suggested in the last sentence many physicists of letter have been disturbed by the introduction of the notion of (the) mass depending on velocity yet that a quantity of matter depending upon the velocity with which it is moving is now generally accepted. Thus Prof Schuster in his lectures on 'The Progress of Physics' (p 104) says :-

---

Your reviewer suggests that two masses be isolated and allowed to interact in any way (note the implication of the idea of force in the phraseology that must be used). He then defines the ratio of the masses as being numerically equal to the inverse ratio of the accelerations, and proceeds 'We may prove that the definition is valid by extending the

12. Dec 98

My dear Thompson

Best thanks for the Tesla

which has arrived.

Our mains are now at 230 volts

instead of 110. It often a

nuisance. Do you happen to know

whether the Tesla will be safe

against damage

with the higher voltage?

I was very sorry not to

see you — & especially for the

cause — I wanted to thank

you for your Faraday book.

It is very interesting & well

done. What an understroom

check you are!

I hope you are better.

I find I am rather short of steam

in my dust & E proof paper

& am answering it. I thought

he had actually installed a

Stalland — but it was not so,

Yours ever OJL
